

Gradient descent

Gradient descent

Gradient descent moves parameters opposite to the gradient.

Learning rate controls the size of each update.

$$w_{\text{new}} = w - \text{learning_rate} * \text{gradient}$$

Reading exercise:

Select the term above to open the translation toolbar.

Ask a small question, then save a note.

Generalization

Overfitting

Overfitting can reduce performance on unseen data.

Compare training performance with validation performance.
